2 The action of procaine on the gastric response during the excitation of the vagus nerve. N. Hristokanei, Gh. Proca, I. Busu, and I. N. Hnescu. *Comun. Acad. Rep. Populare Romane* 3, 223-8 (1953).—In studying the effect of procaine (I) on the gastric response at the excitation of the vagus nerve by administering intravenously 50 mg. I per kg. body wt., it was found that I inhibits the effect of the excitation of the vagus nerve on the heart, although this excitation always causes an excito-motor effect on the stomach. Under these conditions the amplitude of the gastric contractions decreases, the latent period of the excitation of the vagus nerve increases, while the inhibiting action of a new excitation occurring at the height of a gastric contraction disappears. The duration of the contraction is also reduced. Thus I is not completely identical to atropine in its action, its effect on the heart is similar, but that on the stomach is not. Splanchnectomized animals do not respond to excitation after I injection. François Kertész

Action of procaine on respiration. If. N. Hortolomei, Gh. Proca, I. Busu, St. Roman, and I. N. Enescu. Comun. Acad. Rep. Populare Romina 5, 173-84(1955); cf. 1. 50, 24041. The main action of procaine (I) is on the central mechanism of respiration especially on the bulbar respiratory center and on the superior coordination system. On the bulb I diminishes the time of apnea. The action of I on the main centers is influenced by the conservation of cortical activity. I raises the frequency of respiration with intact cortex and sectioned pneumogastrics, but in animals without cortex no such raise is observed. I shortens the duration of the reflex apnea by animals with whole cortex, but without cortex no action of I is manifested. I acts on the pneumotaxic centers as in thermal polypnea, lowers the frequency of respiratory movements. The absence of cortex is marked by a stronger lowering of this frequency

Title : Rare Arrhythmias, Connected with Distrubed Conductivity and
Observed at Poisoning with Digitalis. About Two Clinical Cases

Orig Pub : Med. interna, 1957, 9, No 3, 432-438

Abstract : A patient 32 years old with cardiac insufficiency as a result of rheumatic mitral stenosis after treatment with digitalis experienced an atrioventricular blockage of first degree and an isorhythmical atrioventricular dissociation. Three days after the end of the treatment auricular fibrillation set in, and on the fifth day the sinus rhythm was restored. A patient, 73 years old, suffering from atherosclerosis, experienced after digitalis treatment an atrioventricular blockage 2:1, an arrhythmia, similar to the Luciani-Venkenbach periods but with a reverse sequence, changes in the form of the indent R, and then a return to the regular sinus rhythm. The arrhythmias had a functional nature and were determined by an increased parasympathetic tone and metabolic disturbances

Report of a case in a man of 45 with mitral and aortic failure. The atrial frequency was 100, the ventricular frequency about 35 per minute. The patient died the next morning after the development of block. Ulcerous-vegetative endocarditis was localized on the aortic valves as far as to their insertion. The coronary vessels were free of symptoms. Clinical, ECG and morbid-anatomical description of the case, followed by a discussion of the probable causes of death (due to slightly prolonged ventricular interval or, rather, to ventricular fibrillation).

"Considerations on the Renal Functional Modifications Produced Under the Influence of the Reflexogene Amydaline Zone."

Bucharest, Rovista Sanitara Militara, Vol 59, No 3, May-Jun 63, pp 481-486.

Abstract: Describes the results of a study of 230 patients suffering from sub-acute or chronic amygdaline infections; points out that these infections were always accompanied by various degrees of renal disturbance, as manifested by lowered capacity to eliminate phenosulphonephthaline. Renal function was restored to normal in all cases after amygdalectomy. The importance of testing renal function in cases of amygdaline infections is stressed.

TOPIC TAGS: mouse, toxicity, histology, pathology, muscle physiology, toxicology

ABSTRACT: Studying the toxic action of 4-sulphopamido-3-methylphenoxymethyl-imidazoline in mice, the authors found the toxic dose to be 2.15 grams per kilogram of body weight when administered intramuscularly and 8 grams per kilogram when administered orally. No significant histopathological changes were observed except for one case in which a picture of interstitial nephritis was observed. Changes in the muscle fibers were produced at the injection sites. *[JPRS: 33,500]*

"The Synthesis of Some Isonicotinoylhydrazones and Thiocarbohydrazones and Their Antituberculosis Actions."

Bucharest, Revista Sanitara Militara, Vol 62, No 1, Jan-Feb 66, pp 117-120.

Abstract: The authors synthesized and tested some isonicotinoylhydrazones and thiocarbohydrazones for antituberculosis activity. In general, the activity of the isonicotinoylhydrazones was smaller than that of P.A.S., while that of the thiocarbohydrazones was close to that of PAS, being more intense on staphylococci and less intense on carbonic bacteria. The compounds with the greatest antituberculosis activity were the thiocarbohydrazone of paraamino-o-bromobenzoic aldehyde and of paraamino-o-iodobenzoic aldehyde.

"The Use of the Passive Hemagglutination Reaction for the Study
of Antiamygdaline Autoantibodies as a Diagnostic Method for
Infections of Amygdalian Foci."

Bucharest, Revista Sanitara Militara, Vol 62, No 2, Mar-Apr 66,
pp 329-338.

Abstract: On the basis of a study involving 200 patients, the
authors find the passive hemagglutination reaction as a method
of studying the antiamygdaline autoantibodies a sensitive and
specific diagnostic test. Extract of human tonsils from persons
in blood group O1 was used as antigen; positive reactions were
obtained in 98 percent of the cases involving amygdalian focus
infection, while healthy persons, those suffering from other
diseases, or those whose tonsils had been removed in childhood
gave negative reactions.

Includes 3 tables and a bibliography with 31 entries, of
which 19 Rumanian, 10 French and 2 English-language. -- Manu-
script submitted 3 August 1965.

Title : Establishment of Rational Norms of Sowing Forest Seeds.

Orig Pub: Rev. Padurilor, 1954, 69, No 5, 233-236

Abstract: The suggestions of specialists of scientific-experimental institutes are enumerated on establishment of rational norms of sowing forest seeds for all forest districts of the Rumanian People's Republic, taking into account soil-climatic conditions. As a result of 3 years of experimentation with fir and pine seeds, a relationship was established between the absolute weight of seeds and their germination, and a formula is suggested for determining the sowing norms while taking into account the relationship between seed quality, germination and sprouting energy.

Orig Pub : Rev. Padurilor, 1957, 71, No 4, 230-235
Abstract : Experiments conducted in Rumania have determined that elm and English elm seeds, gathered when mature, sprout successfully after two years.. The reason for the poor germination of these seeds, when planted in the year they are gathered, is obviously the insufficient soil moisture.

The U-wave was present in 29% of 235 cases of coronary disease. The existence of a negative U-wave or its discordance in relation to the T-wave, together with other less distinct ECG signs constitute one more element in the diagnosis of coronary insufficiency.

Title : Introduction of Maritime Pine (*Pinus maritima*) into Bulgaria

Orig Pub : Izv. Tekhn. in-t. Elgar. AN, 1955, No 3, 165-224

Abstract : The article considers in five parts the problems of cultivation of maritime pine in Bulgaria on a wide scale and a number of related problems on introducing the most valuable foreign forest timber varieties for the Bulgarian economy. A detailed forest-cultivation-botanical characterization of maritime pine is stated as well as its lumber-economic significance to the republic. One separate section is devoted to an analysis of the former attempt to introduce this variety

Card : 1/3

BULGARIA / Cultivated Plants. General Problems.

L-1

Abs Jour : Ref Zhur - Biol., No 6, March 1957, No 22672

Abstract : into Bulgaria. The attempt to introduce the maritime pine in the Strandzh Mountains is widely described, when in 1950-1952 large plantings were made. The results are summarized in 11 tables and 10 graphs of investigations of growth and development of these young cultivations and other older plantings of *P. maritima* on the shores of the Black Sea and in the districts of Strandzh (the basic numerical data are furnished). It is noted that this pine successfully tolerates minimal temperatures (down to -20degrees) in these districts, which makes it especially valuable. As to the demands on the soil and to drought resistance, it wins out by far in comparison with the native varieties such as black pine, oak, nut tree and others.

Card : 2/3

BULGARIA /Cultivated Plants. General Problems

L-1

Abs Jour : Ref Zhur - Biol., No 6, March 1957, No 22672

Abstract : In Bulgarian environments it is also resistant to entomophytic pests and in its early age it twice surpasses the speed of growth of the native varieties of white and black pine. The enormous significance of *P. maritima* in the future for planting on wide inconvenient sandy and loamy areas along the seashore is underlined.
